BREAST CANCER SCREENING

OVERVIEW: Breast cancer is the most common cancer and second leading cause of death in women. Although definitive breast cancer prevention is not possible, early detection improves a woman's prognosis. The U.S. Preventive Services Task Force recommends that women age 50 through 69 receive routine breast cancer screening 1 to 2 years with mammography. A review of screening effectiveness studies concludes that such screening can reduce breast cancer mortality by 20% to 30%.

In 1990, breast cancer resulted in $6.5 billion in medical care cost which is more than any other cancer. Reviews of the available cost-effectiveness studies report that mammography screening costs approximately $60,000 per year life gained.

Center for Disease Control (CDC), *An Ounce of Prevention, What are the Returns,* 2d edition October 1999

AFMS POPULATION HEALTH BASED CRITICAL SUCCESS FACTORS

- #3 Proactively deliver preventive services
- #5 Continually evaluate improvement in the population's health status and the delivery
